Background

- Export inland cost per MT was a major and growing share of logistics spend.
- Cost drivers were spread across loading, trucking, depot and port stages.
- Goal: a sustainable reduction in cost per MT without hurting service.

Approach

- Mapped the export inland journey stage by stage, with cost and lead time.
- Used Pareto analysis to isolate the few drivers behind most of the cost.
- Introduced round-trip planning and staggered loading schedules.
- Set a vendor allocation rule based on performance data.

Result

-$2.5/MT

Export inland cost | SGA gold medal

Improvement does not need a big budget - it needs good data and a team willing to question the way things have always been done.
